Care instructions

In order for you to enjoy the stunning textile products from the house of David Fussenegger, we always recommend reading the care instructions provided on the label.

Here are a few additional hints for even better washing results:

Temperature: 30° is enough

High temperatures are not required in order to guarantee the desired washing effect! Today's detergents make your laundry perfectly clean even at low temperatures. It's better to wash at 30 degrees than too hot!

Washing cycle: Wool wash or delicates

The gentler, the better! Modern washing machines all offer very gentle wool washing cycles (delicates/wools), which are also extremely beneficial to our products and at the same time consume less energy!

Detergent: Wool/liquid detergent or shampoo

Detergents designed for wool products or commercially available shampoos develop a large amount of foam, which acts as a thick cushion and protects the textiles against mechanical stresses in the machine. Please read the manufacturer's dosage information and take into consideration different levels of water hardness.

Drying: Air drying and brief tumbling

By selecting a short spin cycle with a low speed of rotations you will prevent damage to the pile and avoid significant pilling. After spinning we recommend air-drying the throw. In order to achieve a particularly fleecy finish you can complete the drying process with a short cycle in the tumble dryer at a low temperature. There is no need to iron.

Fluff build-up

It is entirely normal that fluff is produced initially, in particular with high-pile velour qualities. After the first washing these loose fibres will wash away and the fluff will disappear. Strong build-ups of fluff that are caused by friction in the machine drum can be avoided by filling the washing machine with the optimum load. Please carefully read the manual of your washing machine to find out about the recommended load of laundry of your machine.

Shrinkage:

High quality flannel and velour products from the house of David Fussenegger are characterised by their plush softness, which consequently means that they are not 100% shrink-resistant. After washing wait until the articles are damp before pulling them into shape. This will help to prevent excessive shrinkage.
